

# THE CALLBACK HELL

# setTimeout Function

The `setTimeout()` method calls a function after a number of milliseconds. The `setTimeout()` method executes a block of code after the specified time. The method executes the code only once. `setTimeout()` is an asynchronous function, meaning that the timer function will not pause the execution of other functions in the function's stack. The commonly used syntax of JavaScript `setTimeout` is:

```
setTimeout(function, milliseconds);
```
