

ARRAYS IN JAVASCRIPT

Creating Array in Javascript

An array is an object that can store multiple values at once. For example,

```
const words = ['hello', 'world', 'welcome'];
```

The easiest way to create an array is by using an array literal []. For example,

```
const array1 = ["eat", "sleep"];
```

Accessing Array Elements

You can access elements of an array using indices (0, 1, 2 ...). For example,

```
const myArray = ['h', 'e', 'l', 'l', 'o'];
```

```
// first element
```

```
console.log(myArray[0]); // "h"
```

```
// second element
```

```
console.log(myArray[1]); // "e"
```

Array Properties

- Array in Javascript can be of mixed data types. For Example

```
const newData = ['work', 'exercise', 1, true];
```

- You can find the length of an element (the number of elements in an array) using the length property. For example,

```
const newData = ['work', 'exercise', 1, true];  
const length = newData.length;
```

Common Array Methods

<code>indexOf()</code>	searches an element of an array and returns its position
<code>includes()</code>	checks if an array contains a specified element
<code>push()</code>	adds a new element to the end of an array and returns the new length of an array
<code>unshift()</code>	adds a new element to the beginning of an array and returns the new length of an array
<code>pop()</code>	removes the last element of an array and returns the removed element
<code>shift()</code>	removes the first element of an array and returns the removed element
<code>sort()</code>	sorts the elements alphabetically in strings and in ascending order
<code>slice()</code>	selects the part of an array and returns the new array
