# CSS TRANSITION PROPERTY

# Transition Property

CSS transitions allow you to change property values smoothly, over a given duration.

To create a transition effect, you must specify two things:
- the CSS property you want to add an effect to
- the duration of the effect

Note: If the duration part is not specified, the transition will have no effect, because the default value is 0.

- **transition-delay**
- **transition-duration**
- **transition-property**
- **transition-timing-function**

## transition-timing-function

The transition-timing-function property can have the following values:

- **ease** - specifies a transition effect with a slow start, then fast, then end slowly (this is default)
- **linear** - specifies a transition effect with the same speed from start to end
- **ease-in** - specifies a transition effect with a slow start
- **ease-out** - specifies a transition effect with a slow end
- **ease-in-out** - specifies a transition effect with a slow start and end
- **cubic-bezier(n,n,n,n)** - lets you define your own values in a cubic-bezier function
